

Sample Test Document

This is a comprehensive test document designed to verify PDF to Markdown conversion capabilities. It includes various formatting elements such as headers, paragraphs, tables, and lists. This paragraph intentionally spans multiple lines to test how the conversion handles text that continues across line breaks within the PDF structure.

1. Document Structure

1.1 Multi-level Headers

This section demonstrates how different heading levels are preserved during conversion. The extraction process should maintain the hierarchical structure of the document, converting PDF text styling into appropriate markdown header levels.

2. Text Formatting

This paragraph contains **bold text**, *italic text*, and ***bold italic text***. The conversion process should preserve these formatting elements in the markdown output, using appropriate markdown syntax for emphasis and strong emphasis.

3. Lists and Enumeration

3.1 Unordered List

- First item in the unordered list
- Second item with more details about the content
- Third item demonstrating list formatting

3.2 Ordered List

- 1 First numbered item
- 2 Second numbered item
- 3 Third numbered item

4. Tables and Data

4.1 Simple Table

Feature	Status	Priority
Header Extraction	Implemented	High
Table Processing	Implemented	High

List Formatting	Implemented	Medium
-----------------	-------------	--------

4.2 Complex Table with Multi-line Cells

The table below contains cells with multiple lines of text. This tests the conversion's ability to handle complex table structures and merge multi-line content appropriately.

Component	Description	Notes
PDF Parser	Extracts text and structure from PDF documents	Uses PyMuPDF4LLM for fast extraction
Table Processor	Cleans and formats table cell content removing HTML tags	Merges multi-line cells automatically
Markdown Generator	Converts extracted content to clean markdown format	Optimized for LLM consumption

5. Continuous Content

This is the second page of the test document. It demonstrates how the PDF to Markdown conversion handles content that spans multiple pages. The conversion should maintain document flow and properly handle page boundaries without losing content or introducing artifacts.

5.1 Code and Technical Content

Technical documentation often includes code examples or monospace text. For example: `import pymupdf4llm` or command-line instructions like `python script.py --option value`.

5.2 Summary Table

Test Category	Elements Tested	Expected Outcome
Structure	Headers (H1, H2)	Markdown headers (#, ##)
Formatting	Bold, Italic	Markdown emphasis (**, *)
Lists	Ordered, Unordered	Markdown lists (-, 1.)
Tables	Simple, Complex	Markdown tables with clean cells
Pages	Multi-page	Continuous content flow

6. Conclusion

This sample document provides a comprehensive test case for PDF to Markdown conversion. It exercises all major features including text extraction, formatting preservation, table processing with multi-line cell cleanup, list handling, and multi-page document processing. The resulting markdown should be clean, well-structured, and optimized for consumption by large language models.
